

Further Evaluation of Macrophytes for Species Sensitivity Distribution (SSD) Tests

Guido Gonsior, Theresa Graf, Sara P. Cuellar-Bermudez, Gundula Gonsior, Maren Dill

GG BioTech Design GmbH, Homberg (Ohm), Germany

The OECD guideline 239 assessing the rooted aquatic plant *Myriophyllum spicatum* and the OECD guideline 221 assessing free-floating species *Lemna* spec. are followed to evaluate toxicity to macrophytes in the Tier 1 risk assessment. In addition to one dicotyledon submerged rooted and one monocotyledon free floating species, studies on further species might be needed to refine the risk assessment. In case higher Tier approaches refinements are needed for aquatic plants, the Species Sensitivity Distribution (SSD) is a commonly applied approach.

This leads to the general question: which non-standard test species show good growth under lab condition and can be tested based on the available guidelines? Following this question, we performed tests with non-standard species, including monocotyledons and dicotyledons, emergent, submersed, and free-floating species. We evaluated data of non-standard macrophyte test species based on growth factor/doubling time and coefficient of variation which fulfilled validity criteria according to OECD 239 or OECD 221.

Material & Methods

- Test Duration:14 days (OECD 239); 7 days (OECD 221)
- Test Design:based on OECD 239 or 221; without test item
- Validity Criteria:

OECD 239
 - CV (Yield Fresh Weight) $\leq 35.0\%$
 - Growth Factor (Fresh Weight) ≥ 2.0
 - Growth Factor (Total Shoot Length) ≥ 2.0OECD 221
 - Doubling Time (Frond Number) ≤ 2.5 days
 - Growth Rate (Frond Number) $\geq 0.275 \text{ day}^{-1}$

List of species showing good growth under lab conditions

Species	Group	Species	Group
<i>Ceratophyllum demersum</i>	basal form	<i>Myriophyllum spicatum</i>	Dicotyledons
<i>Egeria densa</i>	Monocotyledons	<i>Nasturtium officinale</i>	Dicotyledons
<i>Elatine hydropiper</i>	Dicotyledons	<i>Nymphoides peltata</i>	Dicotyledons
<i>Elodea canadensis</i>	Monocotyledons	<i>Persicaria amphibia</i>	Dicotyledons
<i>Glyceria maxima</i>	Monocotyledons	<i>Persicaria hydropiper</i>	Dicotyledons
<i>Heteranthera zosterifolia</i>	Monocotyledons	<i>Ranunculus inundatus</i>	Dicotyledons
<i>Hottonia palustris</i>	Dicotyledons	<i>Rotala rotundifolia</i>	Dicotyledons
<i>Hydrocotyle leucocephala</i>	Dicotyledons	<i>Spirodela polyrhiza</i>	Monocotyledons
<i>Callitriche palustis</i>	Dicotyledons	<i>Vallisneria spiralis</i>	Monocotyledons
<i>Lemna gibba</i>	Monocotyledons	<i>Veronica beccabunga</i>	Dicotyledons
<i>Lemna minor</i>	Monocotyledons	<i>Wolffia arrhiza</i>	Monocotyledons
<i>Limnophila sessiliflora</i>	Dicotyledons	<i>Azolla filiculoides</i>	fern
<i>Ludwigia repens</i>	Dicotyledons	<i>Chara globularis</i>	charophyte green algae
<i>Lysimachia nummularia</i>	Dicotyledons	<i>Riccia fluitans</i>	moss
<i>Mentha aquatica</i>	Dicotyledons	<i>Salvinia natans</i>	fern

Microcosm Study with 10 different species (emergent, submersed and free floating)

Single Species Tests (*Callitriche palustris*; *Myriophyllum spicatum*; *Glyceria maxima*)

Results - Growth factor and CV of various Macrophytes; Test Design based on OECD 239

Listed (in the figure and table) is a selection of ten species¹ beeing used several times in tests which makes a representative evaluation of data possible:

- All species show a **Growth Factor > 2.0** for Fresh Weight and Total Shoot Length during the 14-day period.
- All species show a **CV of Fresh Weight (Yield) < 35%**.

Further species which were used rarely within the last 3 years but showed valid tests, are:

Pagostemon erectus, *Ranunculus inundatus*, *Ludwigia repens*, *Limnophila sessiliflora*, *Hydrocotyle leucocephala*, *Callitriche palustris*, *Hottonia palustris* and *Rotala ralundifolia*

Species for which valid tests are difficult to achieve and optimization is needed, are:

Persicaria amphibia and *Hippuris vulgaris*

Note: For data evaluation focus was set on monocotyl and dicotyl plants. Data for other taxa like ferns, moss and macroalgae are under review.

¹ additionally to *Myriophyllum spicatum*

	CV (Yield Fresh Weight) [%]	Std. Dev.	Growth Factor (TSL)	Std. Dev.	Growth Factor (FW)	Std. Dev.
<i>Myriophyllum spicatum</i>	7.4	4.3	8.1	1.6	10.3	2.4
<i>Heteranthera zosterifolia</i>	10.7	3.2	3.2	0.8	4.8	1.3
<i>Lysimachia nummularia</i>	12.9	3.1	3.0	0.6	4.5	1.1
<i>Veronica beccabunga</i>	13.1	1.4	6.8	2.4	7.7	2.4
<i>Nasturtium officinale</i>	13.9	4.2	8.2	2.9	12.2	5.3
<i>Elodea canadensis</i>	14.8	4.2	3.4	0.8	4.0	1.2
<i>Mentha aquatica</i>	15.0	4.6	3.4	0.6	6.9	2.1
<i>Egeria densa</i>	18.3	3.8	4.1	0.9	5.3	1.0
<i>Ceratophyllum demersum</i>	19.5	5.5	3.8	1.0	3.3	0.7
<i>Glyceria maxima</i>	23.3	6.2	2.8	0.4	4.2	1.7
<i>Hygrophyllia polysperma</i>	23.4	1.6	2.4	0.3	2.5	0.3

Doubling Time and Growth Rate of free-floating Macrophytes; Test Design based on OECD 221

	Doubling Time Frond Number [d]	Std. Dev.	Growth Rate (Frond Number)	Std. Dev.
<i>Wolffia arrhiza</i>	2.4	0.55	0.297	0.052
<i>Spirodela polyrhiza</i>	2.0	0.13	0.348	0.028

Beside *Lemna gibba* two fast growing free-floating species mainly beeing tested based on OECD 221 are: *Wolffia arrhiza* and *Spirodela polyrhiza*

- With both species a **Doubling Time** of ≤ 2.5 days for Frond Number during the 7-day period can be achieved.
- In most of the performed tests the **Growth Rate of Frond Number** is $\geq 0.275 \text{ day}^{-1}$.
- Wolffia arrhiza* showed a slower growth compared to *Spirodela polyrhiza* and the number of fronds was increased to generate robust data for dry weight.

Free Floating Species

S. polyrhiza, *W. arrhiza* and *L. gibba*

S. polyrhiza

W. arrhiza

Discussion

Many aquatic plants can be tested under laboratory conditions according to OECD 239 and 221. Some results indicate that the tests developed for terrestrial plants are sometimes not comparable to those for aquatic plants on the basis of mode of action. In particular, the choice between monocotyledonous and dicotyledonous plants is not in all cases suitable for assessing sensitive species. It should be noted that different species can be selected depending on the experience of the laboratories. If toxicity to aquatic macrophytes is unclear, prior screening is recommended. Data from microcosm and mesocosm studies could also be used for the selection of species. Care should be taken regarding species with different growth forms, e.g. *Persicaria amphibia*, *Hippuris vulgaris* and *Hygrophyllia polysperma*, as the coefficient of variation can significantly increase and growth can be slower. A higher variability of results also can be expected when using plants from commercial suppliers. Here, the plants are often grown in hydroponics with different types and amounts of fertilizers and under different light and temperature regimes. Therefore, care should be taken to adapt plants to the laboratory conditions to ensure good growth during the tests.
